

1 **ABSTRACT**

2 Viewing management methods and systems for managing viewing of  
3 multiple live electronic presentations are described. In one described embodiment,  
4 viewers are given an opportunity to register their preferences for viewing certain  
5 events that can occur within a plurality of different electronic presentations. The  
6 selected electronic presentations are simultaneously monitored, during their  
7 broadcast, while a viewer might be watching only one of the electronic  
8 presentations. When one or more of the viewer-defined events is detected, the  
9 viewer is notified that the event is taking place.
